

Cabinets for liquids

Cabinets for liquids

The cabinet is based on the structure of the existing SK cabinets with hinged doors and opening angles of 180°. The cabinets have been designed, among others, for use of the suspension program, such as perforated panels in the doors, sides or rear wall as well as a wide variety of holders and hooks. The door of the cabinet for liquids is provided with vent holes. The cabinets can be equipped with a collecting tub of material thickness 1 or 3 mm with a shelf and grid made from galvanized steel of 1mm thickness. The cabinet for liquids equipped with a tub of material thickness 3 mm enables safe storage of aggressive substances and reduces the risk of their escape.

Basic colour scheme

Unless a required colour is specified in the order, the basic colour scheme of RAL 7035 for the housing and RAL 5012 for the door is used.
